

Thermostat State Machine (TemperatureMachine)

Jude Nana Baffoe

Notes:

- Single event "cycle" drives off -> heat -> cool -> off, bound to the green button (GPIO 24)
- Red button (GPIO 25) fires `processTempIncButton`; Blue button (GPIO 12) fires `processTempDecButton`
- `updateLights()`: in heat, red LED fades if `temp < setPoint`, else solid; in cool, blue LED fades if `temp > setPoint`, else solid
- Default `setPoint` = 72 deg F
